

Traditional Lime Stucco Workshops

For professional stucco applicators, project managers and architects

April 28 ~ May 2, 8 am ~ 4 pm

New Naturita Community Library, Naturita, CO

Cost: \$ 500.00 ~ Substrates to plaster: Strawbale, OSB, ICF

In the past decade, many builders have taken another look at lime as a building material. Lime has been used for millennia, but in the 1800s it was replaced by portland cement as the main binding material in construction.

When installed properly, lime stuccos can last for hundreds of years and require little or no maintenance. To ensure proper placement and protection of lime stucco, applicators should have training to understand the material and how it works.

This training program is designed to expand your knowledge of what it takes to successfully install lime stucco. Topics include: sand gradation and particle size and how they can affect stucco strength; what a Balance Mix is; and mixing and applying lime stucco and colored limewash. This is a hands-on workshop, and participants must bring protective equipment for eyes, hands and body, a hawk and trowel, and a desire to learn.
